Tribe ANTHEMIDEAE1

Anthemideae Cass., J. Phys. Chim. Hist. Nat. Arts 88: 192. 1819. TYPE: Anthemis L.

Anthemidaceae Link, Handbuch 1: 752, 1929.

Perennial to annual herbs, or more rarely shrubs or subshrubs, often aromatic. Leaves mostly alternate, rarely opposite, often dissected, lobed or toothed. Inflorescences corymbose, racemose, paniculate, or solitary. Capitula usually heterogamous, radiate or disciform, rarely homogamous, discoid; involucres cylindrical to globose; phyllaries 1–4-seriate, imbricate, wholly scarious or herbaceous with scarious margins and apices; receptacles flat to convex or convex-conical, naked or rarely pubescent or with persistent or deciduous paleae; marginal florets usually pistillate, the corollas ligulate or rarely absent, homochromatic white, yellow, or red (occasionally pink) to heterochromatic white or cream distally and yellow proximally, entire or 1–3-denticulate; disc florets hermaphroditic or functionally male, the corollas tubular to funnelform, 4–5-merous (rarely 3-merous), usually homochromatic yellow to occasionally deep red, the anthers basally obtuse or short-tailed, the terminal appendages deltoid to ovate, acute to rounded, the style branches truncate, terminally penicillate with the stigmatic surfaces in two, parallel, marginal stripes. Achenes di- or isomorphic, 2–10-ribbed or 1–3-winged, circular or angled-terete to strongly dorsiventrally or laterally compressed; pappus coroniform or occasionally absent.

The Anthemideae is a large tribe consisting of some 101 genera and about 1,400 species (Heywood & Humphries, 1977), occurring primarily in the temperate Northern Hemisphere. In Peru, many species are introduced weeds or escapees from cultivation; however, various members of *Cotula*, *Soliva*, and *Plagiocheilus* are considered native to South America.

Heywood, V. H., and C. J. Humphries. 1977. Anthemideae—Systematic review. *In* Heywood, V. H., et al. (eds.), The Biology and Chemistry of the Compositae, pp. 852–898. Academic Press, London.

KEY TO GENERA OF ANTHEMIDEAE

- Receptacles conspicuously paleaceous²
 Capitula discoid or disciform; outer florets with corollas regularly 5-lobed,
- 1. Receptacles epaleaceous (rudimentary paleae present in *Tanacetum parthenium*)3.

¹Assisted by National Science Foundation Grant DEB-79-05078 (Alwyn H. Gentry, principal investigator).

¹²Cultivars of *Dendranthema morifolium* often possess capitula lacking disc florets and having a proliferation of pistillate, ray florets, each subtended by a palea similar to an inner phyllary.

3. Capitula radiate; outer florets with corollas ligulate and exceeding the disc 4. 4. Leaves pinnatifid
5. Involucres ca. 5 mm wide; receptacles conical and elongating with age VII. Matricaria.
 Involucres 10–20 mm wide; receptacles convex to planar
4. Leaves entire, dentate or deeply lobed, never pinnatifid
3. Capitula discoid or disciform; outer florets with corollas tubular, variously lobed or
bilabiate (absent in Cotula), never conspicuously radiate
8. Outer or marginal florets with corollas bilabiate VIII. Plagiocheilus.
8. Outer or marginal florets with corollas tubular or filiform, regularly 3–5-lobed
(absent in Cotula)
 Corollas of the disc florets regularly 5-dentate
11. Capitula sessile in leaf clusters. X. Soliva. 11. Capitula pedunculate

I. ACHILLEA

Achillea L., Sp. Pl. 899. 1753. TYPE: A. millefolium L.

Perennial herbs. Leaves alternate, 3–4-pinnatifid to entire. Inflorescences corymbose or corymbiform-paniculate, rarely solitary, terminal. Capitula radiate, heterogamous, subsessile or pedunculate; involucres oblong-cylindrical, ovoid, hemispherical, or depressed; phyllaries 3–4-seriate, graduate, the margins scarious; receptacles conic or convex; paleae lanceolate or oblong, membranaceous; ray florets 2–15, pistillate, fertile, the ligules 3-dentate, white, yellow, or sometimes pinkish; disc florets 8–100, hermaphroditic, fertile, the corollas tubular, subcompressed, the bases pouched and enveloping tops of achenes, 5-lobed distally, white, yellow, or pink, the anthers basally obtuse, the terminal appendages ovate, the style branches truncate, penicillate. Achenes oblong or obovate, compressed, glabrous, smooth; pappus absent.

A genus of some 85 species from southeastern Europe and southwestern and central Asia. It is represented throughout Central and South America by the following cultivated and frequently escaping species.

1. Achillea millefolium L., Sp. Pl. 899. 1753. TYPE: Europe, exact locality and collector unknown (LINN, holotype, not seen, IDC Microfiche 117. 609: II. 7).

Aromatic, perennial **herbs** from creeping rootstocks, to 0.5 m tall; stems erect, simple or branched, woolly-pilose. **Leaves** oblanceolate to oblong in outline, 2–3-pinnatifid, 4–10 cm long, 0.5–1.5 cm wide, the ultimate segments linear to linear-lanceolate, 1–2 mm long, ca. 1 mm wide, spinulose-tipped, loosely pilose. **Inflorescences** corymbiform-paniculate, 50–100-flowered; peduncles 1–5 mm long. **Capitula** 4–5 mm high, 2–3 mm wide (excluding rays); involucres oblong to ovoid; phyllaries 4-seriate, the outer ovate, 1.5–2.0 mm long, ca. 1 mm wide, sparsely woolly-pilose to subglabrous, the inner oblong to lanceolate, 4.0–4.5 mm long, ca. 1 mm wide, glabrescent, all keeled, the margins scarious, brown, erose; ray florets usually 5, the ligules orbicular, 2.5–3.0 mm long, ca. 3 mm wide, white to pinkish white to ochroleucous; disc florets 10–25, the corollas 2.5–3.0 mm long, white to ochroleucous. **Achenes** obovate, 1.5–2.0 mm long, compressed, glabrous; pappus absent. Chromosome number: n = 9 (x = 9).

³Chromosome numbers have been extracted from the following chromosome indexes: Fedorov, 1969; Moore, 1973, 1974, 1977.

CUZCO. Anta: Chaccan Chico, 3,490 m, Brunel 477 (F, MO); Santa Ana, El Chaccan, 3,492 m, Brunel 562 (MO), 636 (F, MO).

II. ARTEMISIA

Artemisia L., Sp. Pl. 845. 1753. TYPE: A. vulgaris L.

Annual, biennial, or perennial herbs or shrubs, aromatic, frequently tomentose. Leaves alternate, entire or pinnatifid, often pedate. Inflorescences racemose or paniculate, rarely solitary. Capitula homogamous or heterogamous, numerous, pendulous, or rarely erect; involucres oblong to depressed-globose, narrowly campanulate or hemispherical; phyllaries imbricate, few-seriate, the margins scarious; receptacles convex or hemispherical, naked or conspicuously pilose; florets iso- or dimorphic, the outer pistillate, the corollas filiform, apically bi- or trifid; disc florets hermaphrodite or masculine, the corollas tubular, the limb campanulate, 5-dentate, the anthers obtuse or minutely pointed basally, the terminal appendage deltoid, sometimes subulate-acuminate, the style branches of female florets linear, truncate-penicillate, those of the hermaphrodite florets linear or linear-spatulate, usually penicillate, undivided in functionally male florets. Achenes subglobose to fusiform, terete or somewhat compressed, smooth, 2-ribbed or multistriate, incurved basally; pappus absent.

Approximately 400 species, primarily north temperate, including centers of diversity in Asia, Europe, and western North America. Its members tend to dominate the steppe communities of Asia, "sagebrush" communities of the New World, and the Karoo scrub of South Africa (Heywood & Humphries, 1977). The genus is represented by two naturalized weeds in Peru.

REFERENCE

HEYWOOD, V. H., AND C. J. HUMPHRIES. 1977. Anthemideae—Systematic review. *In* Heywood, V. H., et al. (eds.), The Biology and Chemistry of the Compositae, pp. 852–898. Academic Press, London.

KEY TO SPECIES OF Artemisia

- 1. Annual; cauline leaves glabrous, the lobes linear-lanceolate; receptacles naked
- 1. Artemisia absinthium L., Sp. Pl. 848. 1753. TYPE: Europe (western edge of Asia, ?Russia), exact locality and collector unknown (LINN, holotype, not seen, IDC Microfiche 117. 567: I. 5).

Suffrutescent, perennial **herbs** to 1 m tall, aromatic; stems erect, sericeous at least above. **Leaves** ovate in outline, 2–3-pinnatifid, 1.5–3.0 cm long, 1.5–2.5 cm wide, the ultimate segments oblong, 1.0–1.5 mm wide, subacute, grayish or whitish, sericeous on both surfaces; petioles to 2 cm long. **Inflorescences** narrow to broad panicles, bracteate. **Capitula** disciform, heterogamous, ca. 3 mm high, 3–5(–6) mm wide, pedunculate, often nodding; involucres depressed-globose; phyllaries 2–3-seriate, graduate, the outer oblong, herbaceous, 1–2 mm long, ca. 0.5 mm wide, sericeous, the inner obovate, mostly scarious, ca. 2 mm long, ca. 1.5 mm wide, glandular; receptacles conspicuously pilose; florets 20–50, the outer pistillate, fertile, the corollas filiform, to 1 mm long, the inner florets hermaphroditic, fertile, the corollas cylindric-campanulate, 1.0–1.5 mm long, all yellowish, glabrous. **Achenes** fusiform, glabrous, ca. 1 mm long. Chromosome number: n = 9.

This species is native to Eurasia and North Africa and has been introduced into the New World. It is commonly cultivated for ornamental or medicinal

purposes. In Peru, it is known as "ajenjo," a name also used for the genus *Ambrosia*.

JUNÍN. Jauja: Jauja, Cerrate 3810 (MO).

2. Artemisia annua L., Sp. Pl. 847. 1753. TYPE: Siberia, exact locality and collector unknown (LINN, holotype, not seen, IDC Microfiche 117. 566: II. 4).

Erect annuals to 2 m tall; stems puberulous to glabrous, reddish. Leaves ovate in outline, 2–3-pinnatifid, sessile, the basal segments 3–10 mm long, deeply toothed, remote from next distal pair, median segments 3–4 cm long, regularly and deeply toothed, the ultimate lobes linear-lanceolate, 1–5 mm long, 0.5–1.0 mm wide, glabrous. Inflorescences paniculate. Capitula disciform, heterogamous, 1.5–3.0 mm high, 2.0–3.5 mm wide, pedunculate, often nodding; involucres globose; phyllaries 2–3-seriate, graduate, the outer oblong, herbaceous, ca. 0.6 mm long, the inner ovate-oblong, mostly scarious, ca. 2 mm long, 1.5–2.0 mm wide; receptacles naked; florets 20–25, the outer pistillate, fertile, the corollas filiform, to 1 mm long, the inner florets hermaphroditic, fertile, the corollas cylindric-campanulate, 0.6–1.0 mm long, all yellowish, glabrous. Achenes narrowly turbinate, ca. 0.8 mm long, obscurely striate. Chromosome number: n=9.

This species is a native of Asia and is widely naturalized in central and southern Europe and throughout the New World. In Peru, it is represented by cultivated material only.

JUNÍN. Jauja: Jauja, Ridoutt s.n. (MO).

III. CHRYSANTHEMUM

Chrysanthemum L., s.l., Sp. Pl. 887. 1753. TYPE: C. coronarium L.

Annual herbs, glabrous or pubescent, often strong scented. Leaves alternate, the margins entire, toothed, incised or variously dissected, pubescent or glabrate. Inflorescences solitary or 2–5 on branch tips, often long pedunculate. Capitula radiate, heterogamous; involucres hemispherical or campanulate; phyllaries 3–4-seriate, imbricate, the margins scarious, the costa darkened; receptacles convex, epaleate; ray florets 13–21(-34), the ligules entire or dentate, pistillate, usually fertile, white or yellow, and rarely with reddish bases; disc florets 50–200, hermaphroditic, fertile, the corollas yellow, the tube laterally expanded and 2-winged, the anthers basally obtuse or truncate, the terminal appendage ovate, acute, the style branches narrowly oblong, truncate, penicillate. Achenes without vallecular secretory canals or epicarpic mucilaginous cells, those of the ray florets 3-angled, with the ribs often winged, those of the disc florets cylindrical to cylindrical-triquetrous, ribbed, the adaxial rib sometimes winged; pappus absent.

The genus *Chrysanthemum*, when interpreted in a broad sense, includes about 200 species, mainly natives of Europe, western Asia, and northern Africa, with species naturalized on nearly every continent. Considerable biosystematic evidence indicates that this genus has been quite heterogeneous, and recent workers (Heywood & Humphries, 1977) have recircumscribed the generic limits, thus limiting the genus to a group of three species: *C. carinatum*, *C. coronarium*, and *C. segetum*, all of northern Africa and Europe. These changes have been reflected in several recent floras (e.g., *Flora of Turkey*, 1975; *Flora Europaea*, 1976). In the present treatment, several taxa traditionally treated under *Chrysanthemum s.l.* are treated under other genera (cf. *Tanacetum*, *Dendranthema*, and *Leucanthemum*).

1. Chrysanthemum coronarium L., Sp. Pl. 890. 1753. TYPE: Europe, exact locality and collector unknown (LINN, holotype, not seen, IDC Microfiche 117. 603: II. 3).

Annual herbs to 0.75 m tall; stems erect, glabrous. Leaves oblong to obovate in outline, 2–3-pinnatifid, to 5 cm long, 2–3 cm wide, sessile, the ultimate segments 1–2 mm wide, acute. Inflorescences solitary; peduncles 5–15 cm long, ebractate. Capitula ca. 1 cm high, 1.0–1.5 cm wide (excluding rays); involucres hemispherical; phyllaries 3-seriate, ovate-oblong, 5–10 mm long, 3–5 mm wide, the margins scarious, brownish; ray florets ca. 21(-34), the ligules 1.0–1.5 cm long, ca. 5 mm wide, yellow, cream, or white; disc florets 50–100, the corollas 4–5 mm long, yellow. Achenes dimorphic, the outer triquetrous, the angles produced into wings to 1.5 mm wide, the inner laterally compressed with adaxial wings, prominent ribs on abaxial face and rounded ribs on lateral faces, sometimes those of the center lacking wings, all covered with sessile, non-mucilaginous glands. Chromosome number: n=9.

This species is native to the Mediterranean region and is now a widespread weed in many temperate areas. In Peru, it is cultivated for ornament and often escapes to roadsides and waste places.

JUNÍN. Jauja: Jauja, *Ridoutt s.n.* (MO). CUZCO. Anta: Chaccan Chico, El Chaccan, 3,490 m, *Brunel* 484 (MO).

IV. COTULA

Cotula L., Sp. Pl. 891. 1753. TYPE: C. coronopifolia L.

Annual or perennial herbs, often diminutive, prostrate to decumbent, often rhizomatous or stoloniferous, glabrous to pilose, often with pellucid glands. Leaves alternate, 2–3-pinnatifid, rarely simple, toothed to entire, petiolate or not, the bases amplexicaul or only partly so. Inflorescences solitary, terminal and axillary; peduncles sometimes swollen under the capitula. Capitula monoecious, dioecious, or gynomonoecious, disciform, heterogamous; involucre hemispherical to campanulate; phyllaries 2–many-seriate, subequal, herbaceous, scarious at least marginally; receptacles conical, flat or convex, rarely hemispherical; epaleate; marginal florets pistillate, 1–many-seriate, the corollas filiform, sometimes 2-toothed or with a minute ligula (sometimes corollas lacking); disc florets hermaphroditic, fertile, or functionally male, the corollas cylindric-campanulate, funnelform, or tubular, sometimes with the bases sheathing and extending over the ovary, 4-lobed (rarely 3-lobed), the anthers 4 (rarely 3), basally obtuse or minutely tailed, the terminal appendage ovate or lanceolate, the style branches of the marginal florets linear-lanceolate, of the disc florets oblong, truncate, penicillate. Achenes generally stipitate, terete, or dorsally compressed, winged or not, dorsally convex; pappus absent.

About 90 species, almost cosmopolitan, but mainly South African and in New Zealand, some in North America, Asia, Australia, New Guinea, South America, and the Falkland Islands.

KEY TO SPECIES OF Cotula

1. Receptacle pilose; disc corollas 3-lobed, stamens 3; achenes isomorphic

3. C. mexicana.

- Receptacle glabrous; disc corollas 4-lobed, stamens 4; achenes dimorphic
 Plants annual, pubescent; marginal florets in 3 series; disc corollas white
 - Plants perennial, glabrous; marginal florets in 1 series; disc corollas yellow
 C. coronopifolia.
- 1. Cotula australis (Sieb. ex Spreng.) Hook. f., Fl. Nov. Zel. 128. 1853.

Anacyclus australis Sieb. ex Spreng., Syst. Veg. 3: 497. 1826. TYPE: New Zealand ("Nov. Holl."), exact locality and collector unknown (?P [Herb. Cosson], holotype, not seen).

Annual **herbs** to 20 cm tall, basally branched, thinly villous. **Leaves** 1–2-pinnatifid, oblong in outline, to 6 cm long, to 2 cm wide, the lobes linear-lanceolate, acute, often glabrous above, villous below, sessile, the bases dilated, subamplexicaul. **Inflorescences** solitary, terminating branches; peduncles to 8 cm long, villous with appressed, ascending trichomes. **Capitula** monoecious, disciform, heterogamous, ca. 2 mm high, 4–5 mm wide; involucres hemispherical; phyllaries 2-seriate, equal, oblong, 1.5–2.0 mm long, 0.6–1.0 mm wide, apically obtuse or rounded, the margins scarious; marginal florets stipitate, pistillate, the corollas absent; disc florets hermaphroditic, the corollas tubular, 0.6–0.8 mm long, 4-lobed, white. **Achenes** dimorphic, the outer oblong, ca. 1 mm long, dorsally compressed, laterally winged, glandular, the inner ones obconical, 0.5–0.8 mm long, flattened on the inner face, convex on the outer face, the margins thickened. Chromosome number: n = 10.

This species was originally described from New Zealand and is naturalized in many regions of the world. It is widespread in Peru, occupying a wide range of habitats.

2. Cotula coronopifolia L., Sp. Pl. 892. 1753. TYPE: Ethiopia, exact locality and collector unknown (LINN, holotype, not seen, IDC Microfiche 117. 605: I. 4).

Perennial herbs to 20 cm tall; stems stoloniferous, glabrous, usually much-branched, ascending. Leaves linear to lanceolate, entire to deeply laciniate, or 1–2-pinnatifid, 2–5 cm long, 0.5–1.5 cm wide, glabrous, the bases sessile and sheathing. Inflorescences solitary, terminal; peduncles to 6 cm long, glabrous. Capitula monoecious, disciform, heterogamous, 2–3 mm high, 9–10 mm wide; involucres hemispherical; phyllaries 3-seriate, equal, oblong-lanceolate, 3–5 mm long, 1–2 mm wide, apically obtuse, glabrous, striate, the

margins scarious; marginal florets uniseriate, stipitate, pistillate, the corollas absent; disc florets hermaphroditic, the corollas tubular, 1.2-1.5 mm long, 4-lobed, yellow. Achenes dimorphic, the outer oblong, 1.3-1.8 mm long, dorsally compressed, laterally winged, glandular, the inner ones obconical, 1.0-1.3 mm long, flattened on the inner face, convex on the outer face, the margins thickened. Chromosome number: n=10.

This species was originally described from Africa and is adventive throughout the world. It frequently inhabits aquatic or inundated areas in fresh- and saltwater.

Cotula cabrera Caro, Kurtziana 1: 295. 1961. nom. superfl. (Based upon Soliva pedicellata Ruiz & Pavon.)

Annual, diminutive herbs to 3 cm tall; stems ascending to procumbent, pubescent. Leaves pinnatifid, 1–2(–3) cm long (including petiole), 5–15 mm wide, oblanceolate in outline, the segments oblanceolate to elliptic, 4-paired, 2–5 mm long, 0.6–0.9 mm wide, apically obtuse to subacute, mucronate, entire, glabrous to sparsely villous, villous below; petioles 5–10 mm long, villous, basally dilated, subamplexicaul. Inflorescences solitary; peduncles axillary, to 1 cm long, villous. Capitula monoecious, disciform, heterogamous, 1.5–2.0 mm high, ca. 2 mm wide; involucres campanulate; phyllaries 2-seriate, equal, oblong, 1.0–1.2 mm long, 0.4–0.5 mm wide, sparsely villous, apically obtuse to acute, roseate, the margins scarious; receptacles flat, pilose; marginal florets 2-seriate, stipitate, pistillate, fertile, ca. 10, the corollas absent, the stipe ca. 0.2 mm long, the ovary obovate to oblong, compressed; disc florets ca. 3, hermaphroditic, functionally male, the corollas tubular, ca. 1 mm long, 3-lobed, white. Achenes isomorphic, obovate, 1.3–1.5 mm long, 0.8–1.0 mm wide, dorsally compressed, laterally 2-winged, smooth, glabrous. Chromosome number: n = ca. 56.

This species occupies humid, montane habitats from Mexico to Costa Rica and from Colombia to Argentina. In Peru, it is only known from a few collections from Depto. Amazonas in the north and Depto. Puno in the south.

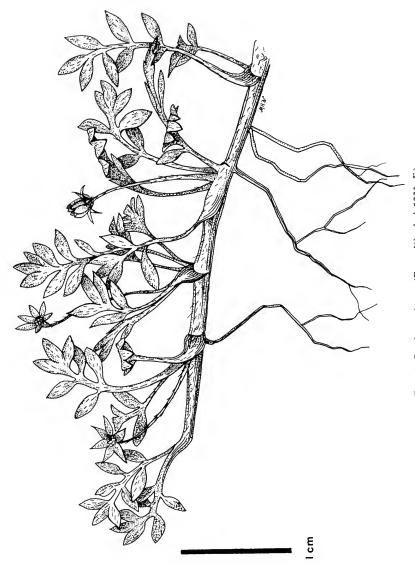

Fig. 1. Cotula mexicana. (From Wurdack 1331, F.)

The earliest legitimate specific epithet for this taxon is *mexicana*; the epithets *minuta*, *pygmaea*, and *pedicellata* are all illegitimate due to homonymy.

AMAZONAS. Chachapoyas: middle eastern Calla-Calla slopes, near km 411–416 of Leimebamba-Balsas road, 3,100–3,250 m, *Wurdack 1331* (F). PUNO. Carabaya: Crucero Alto, 4,540 m, *Stafford 654* (F); Azangaro: Chuquibambilla, 3,850–3,900 m, *Pennell 13391* (F).

V. DENDRANTHEMA

Dendranthema (DC.) Des Moul., Actes Soc. Linn. Bordeaux 20: 561. 1860. TYPE: D. indicum (L.) Des Moul. ≡ Chrysanthemum indicum L.

Perennial herbs, or rarely suffruticose. **Leaves** alternate, oblanceolate to ovate, lobed to 2-pinnatifid (rarely entire), petiolate. **Inflorescences** solitary to corymbose. **Capitula** radiate, heterogamous; involucres hemispherical; phyllaries ca. 3-seriate, imbricate, marginally scarious, brown, erose; receptacles convex to conical, epaleate (paleae present in multi-seriate rayed cultivars); ray florets pistillate, fertile or sterile, the ligules white to purple or yellow (variously colored in cultivars); disc florets hermaphroditic (absent in some cultivars), the corollas tubular-obconical, usually yellow, the tube unwinged, apically 5-lobed, the anthers basally obtuse, the terminal appendage lanceolate to ovate, the style branches oblong, truncate, penicillate. **Achene**s isomorphic, cylindrical-obconical, 5-8-ribbed, without vallecular secretory canals, with or without epicarpic mucilaginous cells; pappus absent. Chromosome number: n = 9 (x = 9).

The genus consists of some 50 species of perennial herbs and subshrubs distributed throughout the Far East, including China, Japan, Korea, Mongolia, USSR, and Europe. The genus is of considerable horticultural interest, with some 7,000 cultivars of autumn-flowering chrysanthemums derived from *Dendranthema morifolium*, the hybrid product of various native species (Heywood & Humphries, 1977).

1. Dendranthema morifolium (Ramat.) Tzvel. Flora U.R.S.S. 26: 373. 1961.

Chrysanthemum morifolium Ramat., J. Hist. Nat. 2: 240. 1792. TYPE: presumably P, not seen.

Suffrutescent perennial herbs to 1.5 m tall, aromatic; stems erect or spreading, leafy. Leaves lanceolate to ovate, 4–9(–12) cm long, 4–6 cm wide, lobed, the segments entire to coarsely toothed, the upper surface glabrous, the lower pilose with 2-armed trichomes, glandular; petioles to 4 cm long, 2 auriculate segments basally. Inflorescences laxly corymbose; peduncles bracteate. Capitula radiate; involucres hemispherical; phyllaries herbaceous, the outer lanceolate to oblong, 5–8 mm long, 1–2 mm wide, the inner ovate, 8–10 mm long, 2–3 mm wide, the margins broadly scarious; receptacles strongly convex, paleate; ray florets multi-seriate, numerous, pistillate, the ligules 1–8 cm long, variously colored (commonly purple or yellow); disc florets absent in ours. Achenes 1.0–1.5 mm long, sterile.

Autumn-flowering perennial chrysanthemums were successfully introduced

from China to France in 1789, and in 1792 the French botanist Ramatuelle proposed the name *Chrysanthemum morifolium* (= *Dendranthema morifolium*) for one of these cultivars called "Old Purple" (Gosling, 1970). Although its origin is obscure, this cultivar is thought to be of hybrid origin, derived from several native Far Eastern species, including *D. indicum*, *D. japonense*, *D. makinai*, and *D. ornatum* (Bailey, 1976). It is not known when it was first introduced into the New World.

The specimens examined thus far from Peru lack disc florets, with the ray florets produced in multiple series. Each ray floret is subtended by a palea, closely resembling an inner phyllary. These cultivars are sterile and are propagated through cuttings. In Peru, they are called "crisanthema."

VI. LEUCANTHEMUM

Leucanthemum Mill., Gard. Dict. Abridg. ed. 4. 1754. TYPE: L. vulgare Lam.

Perennial, rarely annual herbs. Leaves alternate, oblong, spatulate or obovate, the margins crenate, serrate or pinnatifid. Inflorescences solitary or rarely lax corymbs. Capitula radiate, heterogamous, rarely disciform or discoid; involucres hemispherical; phyllaries 3-4-seriate, imbricate, lanceolate to oblong, the margins scarious; receptacles usually convex, epaleate; marginal florets usually ligulate, pistillate, fertile, the corollas white or pinkish, rarely yellow, rarely tubular-campanulate, hermaphroditic or pistillate, yellow; disc florets hermaphroditic, fertile, the corollas tubular, 5-lobed, yellow, the anthers basally obtuse, the terminal appendage ovate, the style branches truncate, penicillate. Achenes isomorphic, oblong-cylindrical, 10-ribbed, the ribs bearing myxogenic cells, vallecular secretory canals present; pappus a corona or auricle, sometimes rudimentary or only on marginal achenes, or absent.

A genus of approximately 25 species native to Europe, North Africa, and southwest Asia. In Peru, the genus is represented by the cultivated taxon, $Leu-canthemum\ vulgare\ (\equiv Chrysanthemum\ leucanthemum\ L.)$, which occasionally escapes and appears naturalized.

- 1. Leucanthemum vulgare Lam., Fl. Francoise 2: 137. 1778. TYPE: based upon Chrysanthemum leucanthemum L.
 - Chrysanthemum leucanthemum L., Sp. Pl. 888. 1753. LECTOTYPE (designated by Bocher & Larsen, 1957): Europe, exact locality and collector unknown, Herb. Cliff. (BM, not seen).

Perennial herbs to 1 m tall, aromatic; stems simple or sparsely branched, glabrous. Basal leaves obovate-spatulate to oblong-obovate, to 15 cm long, incised to crenate, petiolate;

cauline leaves oblong to oblong-lanceolate, to 10 cm long, remotely denticulate or entire, sessile and somewhat clasping at the base, glabrous. **Inflorescences** solitary. **Capitula** radiate, heterogamous, ca. 1 cm high, 1.5–2.0 cm wide (excluding rays); phyllaries lanceolate to oblong, the outer 6–9 mm long, 2.0–2.5 mm wide, the inner ca. 10 mm long, 2.5–3.0 mm wide, the margins scarious, brownish, erose; receptacles convex; ray florets 21–34, the ligules oblong, 2.5–3.0 cm long, ca. 5 mm wide, apically denticulate, the tube 1–2 mm long, white; disc florets 200–300, the corollas tubular, 3–4 mm long, yellow. **Achenes** 2.0–2.5 mm long, blackish with prominent, pale-colored ribs, glabrous; pappus a corona or short unilateral auricle, or absent. Chromosome number: n = 9 (18, 27, 36, 45, 54).

This species, or species-complex, is native to temperate Eurasia from western Europe to China and naturalized throughout North and South America. It is extremely variable within its range in the Old World and has been divided into a large number of questionable species (Heywood, 1976). Individuals occurring in Peru have been previously referred to *Leucanthemum maximum* (Ramond) DC., which is a commonly cultivated, cytological variant (n=45 or 54). Although the plants within our range do possess larger cauline and basal leaves and larger capitula, current taxonomic treatments view it simply as a variant of *L. vulgare* (Heywood, 1976).

Its common name in Peru is "marguarita."

VII. MATRICARIA

Matricaria L., Sp. Pl. 890. 1753. LECTOTYPE (as designated by Pobedimova, 1961): Matricaria recutita L.

Annual herbs, strongly aromatic or odorless. Leaves alternate, variously pinnatifid, the ultimate segments linear or filiform. Inflorescences solitary or sometimes corymbose. Capitula radiate, heterogamous, rarely discoid and homogamous; involucres campanulate to hemispherical; phyllaries 2–3-seriate, equal to subequal, the margins membranous or scarious; receptacles conical, elongating in fruit, epaleate; ray florets (when present) pistillate, fertile or sterile, the ligules white, tridentate; disc florets hermaphroditic, the corollas tubular to cylindric-campanulate, 5-lobed, the anthers basally obtuse, the terminal appendage deltoid, acute, the style branches oblong, truncate, penicillate. Achenes isomorphic, oblong to obovate, often incurved, strongly 3–5-ribbed, glabrous; pappus absent or minutely coroniform.

This genus, when interpreted in the narrowest sense, consists of about five species of northern hemispheric annuals and represents a Mediterranean divergence from the closely related genus *Anthemis* L. (Heywood & Humphries, 1977). *Matricaria* also shares relationships with *Tripleurospermum* Sch. Bip., a distinct genus of some 30 species of Europe, Asia, and North Africa.

Annual **herbs** to 45 cm tall, aromatic; stems erect, branched, striate, glabrous. **Leaves** oblong in outline, 5–7 cm long, 2–3-pinnatifid, the primary segments 10–12-paired, narrowly linear. **Inflorescences** solitary or rarely laxly corymbose; peduncles 1–9 cm long. **Capitula** radiate, heterogamous, 5–6 mm high, 5–6 mm wide (excluding rays); involucres hemispherical; phyllaries 2-seriate, equal, lanceolate to oblanceolate, 2.5–3.0 mm long, 0.3–0.8 mm wide, apically acute to obtuse, the margins membranous, erose, brown; receptacles conical, hollow, epaleate; ray florets 12–15, pistillate, fertile, the ligules oblong, 5–8 mm long, 2–3 mm wide, tridentate, white; disc florets 200–400, the corollas tubular, 1.2–1.5 mm long, yellow. **Achenes** obovate, 0.6–0.9 mm long, smooth dorsally, the inner surface 3–5-ribbed, glabrous, apically truncate; pappus absent, or a membranous corona, fimbriate, white, 0.3–0.9 mm long (disc), 1.3–1.9 mm long (rays). Chromosome number: n = 9.

This taxon has its origin in Eurasia and is adventive in the New World. It is commonly found in markets of Central and South America, where it is sold for preparation of tea used for stomach troubles. In Peru, it is commonly cultivated and frequently escapes, becoming naturalized in fields and other disturbed areas. It is called "manzanilla" throughout Central and South America.

VIII. PLAGIOCHEILUS

Plagiocheilus Arnott ex DC., Prodr. 6: 142. 1837. TYPE: *P. tanacetoides* Haenke ex DC.

Hippia H.B.K., Nov. Gen. Sp. Pl. 4: 301. 1820, not *Hippia* L., Mant. Pl. Alt.: 158, 291. 1771. TYPE: *H. peduncularis* H.B.K. ≡ *P. peduncularis* (H.B.K.) Wedd.

Annual or perennial herbs. Leaves alternate, 1–2-pinnatifid. Inflorescences solitary or corymbose. Capitula disciform, heterogamous; involucres hemispherical; phyllaries 2–3-seriate; receptacles convex to conical; marginal florets multiseriate, pistillate, the ligules bilabiate, the outer entire or bidentate, the inner short, entire or bidentate, white; disc florets hermaphroditic, functionally male, the corollas funnelform, yellow, (4–)5-lobed, the anthers basally obtuse, the terminal appendages ovate, the style branches of marginal florets long, filiform, of the disc florets short, truncate. Achenes obconical, subcompressed laterally, glandular, puberulent or glabrous; pappus absent.

A genus of perhaps five species from Colombia to Argentina. In Peru, three species are known from various high-elevation, moist habitats.

The tribal status of this genus is open to question. Grau (1977) and Robinson & Brettell (1973) have suggested that it belongs in the Astereae. However, it is here accepted in the Anthemideae, a position supported by its general morphology, breeding system, and floral biology (Heywood & Humphries, 1977; Turner, pers. comm.). Its closest affinities appear to be with other southern hemispheric genera, including *Cotula*, *Centipeda*, *Soliva*, and *Abrotanella*.

⁴Other synonyms are listed by Grierson (1974). Only the names listed have been used for Peruvian material.

KEY TO SPECIES OF Plagiocheilus

- 1. Inflorescences corymbose
 1. P. bogotensis.

 1. Inflorescences solitary
 2.

 2. Leaves 2-pinnatifid, pilose with flaccid, uniseriate trichomes
 3. P. solivaeformis.

 2. Leaves 1-pinnatifid, arachnoid-tomentose
 2. P. frigidus.
- 1. Plagiocheilus bogotensis (H.B.K.) Wedd., Chlor. And. 1: 62. 1865.

Hippia bogotensis H.B.K., Nov. Gen. Sp. Pl. 4: 237. ed. fol. 1818. TYPE: Colombia, Cundinamarca, "prope Santa Fe de Bogota," Humboldt & Bonpland s.n. (P, holotype, not seen, IDC Microfiche 6209. 113: II. 2).

Leptinella bogotensis (H.B.K.) DC., Prodr. 6: 142. 1837.

Plagiocheilus prostratus Benth., Pl. Hartw. 136. 1844. TYPE: Ecuador, Loja, "in montibus Loxa," Hartweg s.n. (K, holotype, not seen; P, isotype, not seen; F, photo).

Annual or perennial herbs to 0.3 m tall; stems decumbent to ascending, arachnoid to glabrate. Basal leaves obovate-spatulate to oblong-obovate in outline, to 14 cm long (including petiole), 2-pinnatifid, the ultimate segments lanceolate, sparsely pilose; petioles to 5 cm long, basally dilated, clasping; cauline leaves ovate to obovate in outline, 2.0–3.5 cm long, 1.5–2.0 cm wide, 2-pinnatifid, the segments lanceolate, pilose, sessile, the bases dilated, incised, clasping. Inflorescences corymbose. Capitula 2–3 mm high, 4–5 mm wide; phyllaries 2-seriate, equal, broadly lanceolate to ovate, ca. 1.5 mm long, ca. 1 mm wide, apically obtuse, the margins scarious, nerved, persistent; marginal florets multiseriate, pistillate, the ligules white, bilabiate, the outer narrowly spatulate, ca. 0.5 mm long, the inner minute; disc florets 30–50, the corollas funnelform, ca. 1.5 mm long, 5-lobed, yellow. Achenes obconical, subcompressed laterally, ca. 3 mm long, puberulent, glandular, whitish; pappus absent.

Plagiocheilus bogotensis occupies moist, montane habitats from Colombia to northern Peru (2,100–3,100 m). It most closely resembles *P. tanacetoides* Haenke, a lowland, annual species of northeastern Argentina and is distinguished from that species by its more deeply incised and generally less pubescent leaf segments.

Bentham's *Plagiocheilus prostrata*, described from Ecuador, appears to be a variation in habit and is here reduced to synonymy.

2. **Plagiocheil**us fri**gid**us Poepp. & Endlich., Nov. Gen. Sp. Pl. 3: 48, *t.* 248B. 1843. TYPE: Peru, Pasco, "circum Cerro de Pasco," *Poeppig s.n.* (W, holotype, not seen).

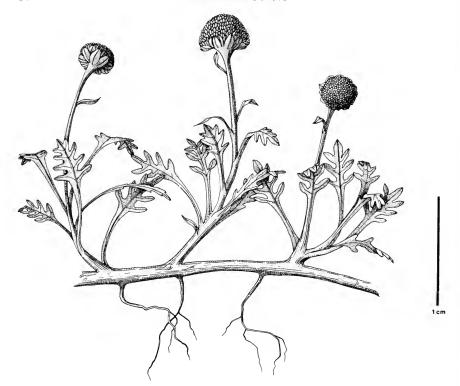

Fig. 2. Plagiocheilus frigidus. (From Gentry et al. 19226, MO.)

Perennial, suffruticose herbs, caespitose; stems stoloniform. Leaves oblong-spatulate in outline, 8–25 mm long (including petiole), ca. 5 mm wide, pinnatifid, the segments entire or 1-lobed, lanceolate, 1.5–2.5 mm long, 0.6–1.0 mm wide, apiculate, glabrous to sparsely arachnoid; petioles to 1 cm long, margined, basally arachnoid. Inflorescences solitary; peduncles to ca. 2 cm long, 1–2-bracteolate, the bracteoles linear to oblanceolate, entire to laciniate. Capitula 2.5–3.0 mm high, 4–5 mm wide; phyllaries ca. 3-seriate, oblong-lanceolate to obovate, 1.5–2.0 mm long, ca. 1 mm wide, apically obtuse to rounded, the margins scarious; marginal florets multiseriate, pistillate, the ligules white, bilabiate, the outer oval, ca. 0.2–0.4 mm long, entire to retuse, the inner minute, cleft; disc florets 20–40, the corollas funnelform, 1.0–1.5 mm long, 5-lobed, yellow. Achenes obconical, subcompressed laterally, ca. 1 mm long, glandular, glabrous; pappus absent.

Plagiocheilus frigidus appears to be restricted to the type locality, in the vicinity of the Lago de Junín in Depto. Pasco (ca. 4,100 m).

PASCO. Pasco: vicinity of Lago de Junín, between Junín & Cerro de Pasco, Gentry et al. 19226 (MO).

3. **Plagiocheilus solivaeformis** DC., Prodr. 6: 142. 1837. TYPE: Bolivia, no exact locality, 1829, *Pentland s.n.* (G–DC, holotype, not seen, IDC Microfiche 800. 1035: I. 4).

Prostrate **herbs**; stems stoloniform. **Leaves** ovate-spatulate in outline, 1.0–2.5 cm long (including petiole), 6–10 mm wide, 2-pinnatifid, the ultimate segments unequally 2–5-

lobed, sparsely to densely pilose with flaccid, uniseriate trichomes; petioles 5–15 mm long, ciliate. **Inflorescences** solitary; peduncles 0.5–6.0 cm long, 1–3-bracteolate, the bracteoles linear to oblanceolate, entire to pinnatifid. **Capitula** 3–4 mm high, ca. 5 mm wide; phyllaries 2-seriate, oblong to obovate, ca. 2 mm long, 1.0–1.2 mm wide, apically obtuse to rounded, the margins scarious; marginal florets multiseriate, pistillate, the ligules white, bilabiate, the outer oval, ca. 0.5 mm long, entire to retuse, the inner minute, cleft; disc florets 20–50, the corollas funnelform, ca. 2 mm long, 5-lobed, yellow. **Achenes** obconical, subcompressed laterally, ca. 1 mm long, glandular, glabrous; pappus absent.

Plagiocheilus solivaeformis is distributed from Colombia to Bolivia in moist, montane habitats (2,700–4,500 m). It has considerable morphological variation within its range and several of these morphs have been afforded specific status (P. peduncularis in Ecuador, and P. ciliata in Bolivia). In Colombia, Cuatrecasas (1954) has recognized two subspecies, P. solivaeformis subsp. colombianus Cuatr. and subsp. multiflorus Cuatr., based upon the degree of leaf division and capitula size. The Peruvian material examined in the present study appears typical for the species.

AMAZONAS. Chachapoyas: uppermost slopes and summit of Cerros de Calla-Calla, near kms. 403–407 of Balsas-Leimebamba road, 3,400–3,550 m, Wurdack 1712 (F). HUÁNUCO. Sánchez Carrión: no exact locality, Sagastegui 9442 (F, MO).

IX. SANTOLINA

Santolina L., Sp. Pl. 842. 1753. TYPE: S. chamaecyparissus L.

Shrubs to subshrubs, rarely herbaceous, strongly aromatic; stems decumbent or ascending, much-branched, leafy. Leaves alternate, pinnatifid, the segments pectinate or conferted, sessile. Inflorescences solitary. Capitula discoid, homogamous; involucres hemispherical; phyllaries 3–4-seriate, imbricate, the margins scarious; receptacles convex, paleaceous; disc florets hermaphroditic, the corollas tubular, 5-lobed, expanded basally and encircling the top of the achenes, yellow to white, the anthers basally obtuse, the style branches flattened, truncate, penicillate. Achenes 3–4(–5)-angled in section, glabrous; pappus absent. Chromosome number: n=9 (x=9).

A genus of some 18 species from western Mediterranean regions. Various members are cultivated for ornament and often become established in waste places.

1. Santolina chamaecyparissus L., Sp. Pl. 842. 1753. TYPE: Europe, exact locality and collector unknown (LINN, holotype, not seen, IDC Microfiche 117. 561: III. 2).

Subshrubs to 20 cm tall; stems erect or ascending, green to gray, tomentose. Leaves narrowly linear or oblanceolate in outline, 5–15(–30) mm long, densely pectinate-dentate to pinnatifid, often vermiform, tomentose-puberulent, aromatic, the segments to 2 mm long, obtuse. Inflorescences solitary; peduncles to 3 cm long. Capitula 5–6 mm high, 5–8 mm wide; involucres hemispherical, phyllaries 3-seriate, lanceolate to obovate, 3.0–3.5 mm long, 0.75–1.0 mm wide, carinate, tomentose-puberulent, the outer apically narrowly oblong, scarious, lacerate, the inner apically rounded, scarious, lacerate; receptacles convex, paleaceous, the paleae ca. 3.5 mm long, enfolding the florets, scarious, apically puberulent; florets 100–150, the corollas cylindrical to narrowly funnelform, 3.0–3.5 mm long, conspicuously exceeding the involucres, the tube of the marginal florets usually curved, cream to bright yellow. Achenes narrowly obconical, 1.5–2.0 mm long, 3–4-angled in section, glabrous.

This taxon is commonly cultivated for ornamental purposes and was probably introduced in Peru from the Mediterranean region where it is native.

LIMA. Lima: Lima, Soukup 995 (F).

X. SOLIVA

Soliva Ruiz & Pavon, Flor. Peruv. Chil. Prodr.: 113, t. 24. 1794. TYPE: S. sessilis Ruiz & Pavon.

Annual herbs to 15 cm tall, rosulate, essentially acaulescent; stems stoloniferous. Leaves alternate, deeply 3-pinnatifid or rarely 2-pinnatifid, the segments lance-linear or linear-deltoid; petioles slender. Inflorescences solitary, sessile in clusters of leaves. Capitula disciform, heterogamous; involucres hemispherical; phyllaries 2-seriate, subequal, the margins scarious or membranous; receptacles flat to subconical, epaleate; marginal florets pistillate, fertile, the corollas absent; disc florets hermaphroditic, functionally male, the corollas funnelform, 4-lobed, white, the anthers 4, basally obtuse, the terminal appendages ovate, the styles of the marginal florets rigid, spinelike, apically bifurcated, the branches filiform, caducous, of the disc florets undivided, truncate, penicillate. Achenes dorsiventrally flattened, convex, often with lateral wings or thickenings, crowned by the persistent styles, equaling the achenes in length; pappus absent. Chromosome numbers: n=+55, 59–60.

A genus of approximately nine species centered in southern South America, but adventive in North America, Europe, Asia, Australia, and New Zealand. Only two species have been collected in Peru.

REFERENCE

Cabrera, A. L. 1949. Sinopsis del género *Soliva* (Compositae). Notas Mus. La Plata, Bot. 14: 123–139.

KEY TO SPECIES OF Soliva

- 1. **Soliva neglecta** Cabrera, Notas Mus. La Plata, Bot. 14: 128. 1949. TYPE: Argentina, Jujuy, Santa Ana, en praderas a 3,100 m, *Burkart & Troncoso* 11665 (LP, holotype, not seen; SI, isotype, not seen).

Annual herbs to 4 cm tall, acaulescent; stems stoloniferous, villous. Leaves rosulate, oblanceolate-spatulate in outline, 2-pinnatifid, 1.5–3.0 cm long (including petioles), 4–5 primary lobes, generally 3–4-parted, the ultimate segments lanceolate, 2–3 mm long, 0.5–0.7 mm wide, mucronate, villous; petioles to 1 cm long, basally dilated, membranous. Inflorescences solitary, sessile in center of leaf rosettes. Capitula 3–4 mm high, 5–6 mm wide; phyllaries 2-seriate, ovate to oblong, ca. 3 mm long, 2.0–2.5 mm wide, densely villous, apically obtuse to rounded; marginal florets 20–30; disc florets 5–10, the corollas 1.2–1.4 mm long. Achenes 2.5–3.0 mm long, obovate, dorsally compressed, glabrous, the lateral wings terminating in divergent projections, the styles persistent, rigid, spinelike, to 1.5 mm long, the apex caducous.

This species was previously only known from the type locality in northwestern Argentina, some 2,000 km disjunct to the southeast of its locality in Peru. It is morphologically closest to *Soliva sessilis* Ruiz & Pavon (Chile) and *S. pterosperma*

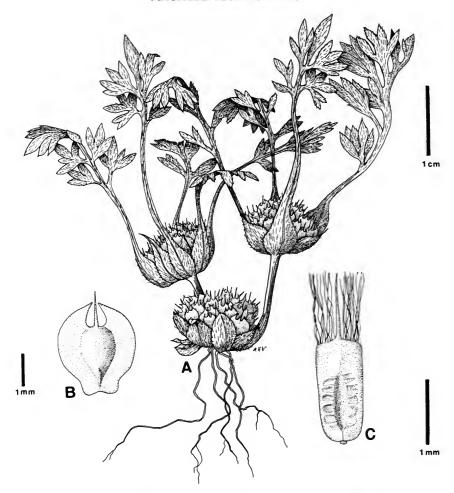

Fig. 3. Soliva neglecta. A, habit; B, achene; C, achene from S. stolonifera. (From Cerrate 2515, MO.)

(Juss.) Less. (Argentina, Uruguay, and Brasil), but it differs from these species in possessing glabrous achenes.

ANCASH. Bolognesi: Quero, al E de Huasta, 3,600 m, Cerrate 2515 (MO).

2. Soliva stolonifera⁵ (Brot.) Loudon, Hort. Brit.: 364. 1830.

Hippia stolonifera Brot., Fl. Lusit. 1: 72. 1801. TYPE: Portugal, exact locality and collector unknown (LISU, holotype, not seen).

Gymnostyles nasturtiifolia Juss., Ann. Mus. Natl. Hist. Nat. 4: 262. 1804. TYPE: Argentina, Buenos Aires, Commerson s.n. (P-JU, holotype, not seen, IDC Microfiche 6206. 670: II. 6).

Soliva nasturtiifolia (Juss.) DC., Prodr. 6: 142. 1837.

 5 Other synonyms are listed by Cabrera (1949). Only the names listed have been used for Peruvian material.

Annual herbs to 5 cm tall; stems stoloniferous, glabrous. Leaves rosulate, oblanceolate-spatulate in outline, 1–2-pinnatifid, 2–4 cm long (including petioles), 3–5 primary lobes, entire or 1–3-lobed, the ultimate segments oblanceolate to elliptic, 1.5–5.0 mm long, 0.3–1.0 mm wide, mucronate, villous; petioles to 1 cm long, basally dilated, membranous. Inflorescences solitary, sessile in center of leaf rosettes. Capitula 2–3 mm high, 4–6 mm wide; phyllaries 2-seriate, lanceolate to oblong, 2–3 mm long, 0.5–1.0 mm wide, sparsely villous, apically obtuse to rounded; marginal florets 30–40; disc florets 6–10, the corollas 1.2–1.5 mm long. Achenes obconical, 1.5–2.5 mm long, dorsally compressed, the wings narrow, transversely rugose, terminating in two divergent, lateral projections, the styles persistent, rigid, spinelike, to 2 mm long.

This species is native to Uruguay and Argentina and has become naturalized in Europe, the Azores, the Canary Islands, and the United States. It is apparently rare in Peru, being represented by only one collection.

LIMA. Huarochiri: Rió Blanco, Macbride & Featherstone 819 (F).

XI. TANACETUM

Tanacetum L., Sp. Pl. 843. 1753. TYPE: T. vulgare L.

Annual or perennial herbs, sometimes scapiform, rarely suffruticose, often rhizomatous, aromatic; stems erect or ascending, usually leafy and branched, pubescent to glabrous. Leaves alternate, entire, toothed, pinnatifid or 1–3-pinnatisect. Inflorescences solitary or more often corymbose. Capitula radiate, heterogamous, rarely disciform, heterogamous, or discoid, homogamous; involucres hemispherical or campanulate; phyllaries 3-seriate, imbricate, lanceolate or oblong, often with scarious margins and apices; receptacles flat to convex, naked or with small, rudimentary paleae; marginal florets usually ligulate (rarely absent), uniseriate, usually pistillate, the ligules white, yellow, or pink; disc florets hermaphroditic, the corollas tubular, 5-lobed, yellow, the anthers basally obtuse, the terminal appendages elongate, obtuse, the styles basally enlarged, the branches apically truncate, penicillate. Achenes isomorphic, cylindrical or clavate, 3–10-ribbed, glabrous, often glandular; pappus a short corona, usually unevenly toothed or lobed, sometimes unilateral and developed on the posterior side.

A genus of about 70 species of annuals and herbaceous perennials, with centers of diversity in southwest Asia and the Caucasus, although various species are found throughout temperate regions of the northern hemisphere. In Peru, three introduced species are common escapes from cultivation.

KEY TO SPECIES OF Tanacetum

- - 2. Leaf segments narrowly lanceolate to oblong-lanceolate, densely silvery-sericeous; capitula solitary; involucres 10–15 mm in diameter 1. *T. cinerariifolium*.

1. Tanacetum cinerariifolium (Trev.) Sch. Bip., Tanacet. 58. 1844.

Pyrethrum cinerariifolium Trev., Ind. Sem. Hort. Vratislav. App. 2: 2. 1820. TYPE: not seen

Perennial herbs to 50 cm tall, silvery-gray, sericeous. Basal leaves oblanceolate-spatulate, to 10 cm long (including petiole), pinnatifid to palmatifid, the segments narrowly lanceolate to oblong-lanceolate, glandular-punctate, sericeous; cauline leaves lanceolate to oblanceolate, entire to pinnatifid or palmatifid, 3–6 cm long; glandular-punctate, sericeous; petioles widely margined, 1–3 cm long. **Inflorescences** solitary; peduncles to 30 cm long, striate, sericeous, bracteate. **Capitula** radiate, heterogamous, 6–10 mm high, 10–15 mm wide (excluding rays); involucres hemispherical; phyllaries 3-seriate, imbricate, the outer ovatelanceolate, 3–5 mm long, 1.0–1.5 mm wide, puberulent, the inner oblong to obovate, 5–6 mm long, 1.5–2.0 mm wide, the margins scarious, lacerate; receptacles convex, epaleate; ray florets 13–21, pistillate, the ligules oblong, 8–16 mm long, 2–4 mm wide, white; disc florets ca. 100, the corollas 2–3 mm long, 5-lobed, yellow. **Achenes** cylindrical, 2.5–3.5 mm long, curving inward, 5-ribbed, glandular; pappus an irregularly lobed corona, 0.7–1.0 mm high. Chromosome number: n=9.

This species is native to western Yugoslavia and Albania and cultivated throughout southeastern and east-central Europe as an insecticide. In Peru, it is cultivated for its insecticidal properties and horticultural purposes. It is called "piretro."

2. Tanacetum parthenium (L.) Sch. Bip., Tanacet. 55. 1844.

Matricaria parthenium L., Sp. Pl. 890. 1753. TYPE: Europe, exact locality and collector unknown (BM, holotype, not seen).

Chrysanthemum parthenium (L.) Bernh., Syst. Verz. Plf. Erfurt 145. 1800.

Perennial herbs to 80 cm tall, aromatic; stems erect, densely leafy, prominently angled, puberulent to glabrate. Leaves ovate in outline, 3–12(–15) cm long (including petioles), 1–2-pinnatifid, the primary segments 3–5-paired, 0.7–3.5 cm long, 0.5–2.0 cm wide, usually 3–7-lobed, the margins dentate or pinnatifid, the ultimate segments oblong to lanceolate, obtuse to acute, mucronate, puberulent to glabrous, punctate-glandular beneath; petioles 0.5–3.5 cm long. Inflorescences laxly corymbose, 5–20(–30)-flowered; peduncles 3–8 cm long, puberulent, bracteate. Capitula radiate, heterogamous, 3–5 mm high, 9–11 mm wide (excluding rays); involucres hemispherical; phyllaries 3-seriate, imbricate, lanceolate, 2.0–3.5 mm long, 0.3–0.6 mm wide, keeled, stramineous, puberulent, glandular, the margins scarious, ciliolate; receptacles convex, sparsely paleaceous; paleae oblanceolate, ciliolate; ray florets 13–21, the ligules 4–6(–9) mm long, 2–4 mm wide, oval to oblong, 3-denticulate, white, the tube ca. 1 mm long, dorsiventrally compressed, enlarged near the base; disc florets 150–300, the corollas cylindrical, 1.5–2.0 mm long, 5-lobed, yellow. Achenes cylindrical, 1.0–1.6 mm long, curving inward, 5–8-ribbed, glandular; pappus absent or an irregularly lobed corona, 0.1–0.3 mm high. Chromosome number: n=9.

This species is native to the Balkan peninsula and has long been cultivated for ornament and as a medicinal plant throughout Europe. It is a common introduction throughout the New World and often escapes from cultivation. Label datum indicates that it is used in Peru medicinally as follows (*Stork & Horton 10265*): "Infusion of leaves and stems, as well as flowers, applied externally to relieve stomach trouble." It is called "Santa Maria" in Latin America.

AMAZONAS. Bongara: Pomacochas, 2,200–2,300 m, Ferreyra 15425 (MO); Chachapoyas: Chachapoyas, 2,700 m, Williams 7543 (F), 7550 (F). CUZCO. Anta: Santa Ana, El Chaccan, 3,511 m, Brunel 550 (F, MO); Cuzco: Picchu, cerca Cuzco, 3,440 m, Brunel 17 (F, MO). HUANCAVELICA. Tayacaja: Salcabamba, 3,250 m,

3. Tanacetum vulgare L., Sp. Pl. 844. 1753. TYPE: Europe, exact locality and collector unknown (BM, holotype, not seen).

Perennial herbs to 1.5 m tall, aromatic; stems sparsely pubescent, glandular. Basal leaves oblanceolate-spatulate in outline, to 15 cm long (including petiole), 2-pinnatifid, the primary segments 7–10-paired, oblong to oblanceolate, 2–5 cm long, the ultimate segments oblong to lanceolate, serrate or irregularly toothed; petioles 3–5 cm long; cauline leaves ovate in outline, to 10 cm long, sessile, 2-pinnatifid, the primary segments 9–12-paired, oblong to oblanceolate, 2–5 cm long, the ultimate segments oblong to lanceolate, serrate or irregularly toothed, to 1 cm long, glabrous to sparsely pubescent. Inflorescences corymbose, 20–200-flowered. Capitula disciform, heterogamous, 4–5 mm high, 5–10 mm wide; involucres hemispherical; phyllaries 3-seriate, imbricate, the outer linear to lanceolate, 2.0–2.5 mm long, 0.6–1.2 mm wide, the inner ovate to oblong, 2.5–3.0 mm long, 1.0–1.5 mm wide, all with whitish, scarious margins; marginal florets 20–50, 1-seriate, pistillate, the corollas cylindrical, ca. 1.5 mm long, zygomorphic, yellow, apically 3-lobed, the middle lobe shorter; disc florets 200–300, the corollas cylindrical, 2–3 mm long, 5-lobed, yellow. Achenes cylindrical, 1.2–2.0 mm long, 5-ribbed, glandular; pappus an irregularly lobed corona, 0.1–0.3 mm high. Chromosome number: n = 9.

This species is native to Eurasia and is adventive throughout the New World. Although it has long been employed as an herbal remedy to rid the body of worms, it is uncertain if it is employed as such in Peru.

CUZCO. Anta: Llamaponga, El Chaccan, 3,580 m, Brunel 104 (F, MO).
